## GENERAL INFORMATION

This series of helical gear units has been expressly designed for application in the lifting field, distinguished by intermittent operation.

The different mechanical and dimensional characteristics have been studied to better adapt to the specific requirements of this field of application.

To select the gear units, the service factor is determined according to the FEM and ISO standards relating to lifting mechanisms, on the basis of the type of operation, the load condition and the requested duration. Mechanical efficiency  $\eta$  for each size of this series of gear units is 97%.

## GEARS AND SHAFTS

The gears are cylindrical, with helical profile ground after heat treatment. They are made of casehardened and tempered steel *20MnCr5, 16NiCr4, 18CrMo4 UNI EN 10084*.

All the gears have been designed according to *ISO 6336* and *DIN 3990* standards and have been checked according to the *AGMA 2001* standard.

The cylindrical low-speed shafts are made of hardened and tempered steel type *42CrMo4 UNI EN 10083-1* while the hollow low-speed shafts are made of *Fe510 UNI EN 10025*. The high-speed shafts are made of casehardened and tempered steel, or hardened and tempered steel.

The standard version shafts are cylindrical with key according to *UNI 6604-69*. In this case, the fitting of the output coupling on the low-speed shaft must be made with interference. The low-speed shafts can also be made with splined ends for fitting by means of broached flange, while for special applications, a version also exists with hollow low-speed shaft with key seat. The high-speed shafts have been designed with elongated end to allow fitting a brake between motor and gear unit.

## BEARINGS

The bearings are top quality and sized on the basis of the duration envisaged by the selected use class.

## GEAR CASING

The casings of the gear units are made of grey cast-iron *EN-GJL-250 UNI EN 1561* up to size 93, while larger sizes are made of electrically-welded and distended steel. On request, these can however be made of electrically-welded and distended steel for all sizes.

All the casings are made in two parts to make gear unit fitting and maintenance easier.

Furthermore, the steel casings feature a further inspection cover.

The configuration of the cast-iron casing allows fitting the gear unit in either horizontal or vertical position.

## DESIGNATION

|          |          |           |           |           |           |          |          |          |

## SYMBOLS AND UNIT OF MEASUREMENT

| SYMBOL   | PARAMETER                               | UNIT OF MEASUREMENT |
|----------|---|---------------------|
| $f_s$    | Mechanical service factor               |                     |
| $f_N$    | Nominal performance corrective factor   |                     |
| $f_a$    | Ambient correction factor               |                     |
| $i_N$    | Nominal transmission ratio              |                     |
| $i_r$    | Actual transmission ratio               |                     |
| $n_1$    | High speed                              | rpm                 |
| $n_2$    | Low speed                               | rpm                 |
| $P_N$    | Nominal power                           | kW                  |
| $P$      | Absorbed motor power                    | kW                  |
| $\eta$   | Efficiency                              |                     |
| $T$      | Torque                                  | Nm                  |
| $T_N$    | Nominal torque                          | Nm                  |
| $t$      | Temperature                             | °Celsius            |
| $P_t$    | Thermal capacity                        | kW                  |
| $P_{tN}$ | Nominal thermal capacity                | kW                  |
| $F_{r1}$ | High-speed shaft overhung load          | N                   |
| $F_{r2}$ | Low-speed shaft overhung load           | N                   |
| $J_1$    | High-speed shaft mass moment of inertia | kgm <sup>2</sup>    |

## SELECTING THE GEAR UNIT

Table 1 shows the various load states and useful durations for determining the service factor to be adopted to select the gear unit. The service factor stems from the combination of a series of conditions related to duration, overloads, start-up frequencies, type of motorisation, speed and reliability, in accordance with the conditions relating to the classes of lifting mechanisms indicated in the FEM 1.001/III and ISO 4301/1 standards.

$$(1) \quad k = (km)^{1/3} = \left( \sum_{i=1...n} ((P_i/P_{max})^3 \times (t_i/T)) \right)^{1/3}$$

k : average equivalent spectrum factor

km : spectrum factor

t<sub>i</sub> : average duration of each load level

T : total use duration

P<sub>i</sub> : amplitude of each load level

P<sub>max</sub>: amplitude of maximum load level

L1 : mechanisms usually subject to low loads and rarely to maximum load

L2 : mechanisms usually subject to moderate loads and rarely to maximum load

L3 : mechanisms normally subject to heavy loads and frequently to maximum load

L4 : mechanisms regularly subject to maximum load.

- (2) The durations are purely theoretical, they cannot be guaranteed and can be obtained from daily average use, from the number of working days and from the expected years of operation.
- (3) The indicated *fs* service factors are only valid for lifting equipment and take into account the maximum indicated number of starts and a max torque on the gear unit during T2 max start and braking intervals, limited by the *kz* peak factor.
- (4) In the case in which  $Fr_2 \leq (Fr_2 \text{ max}/2)$  it can be considered: for L3-T8, L4-T7  $fs \geq 1,5$ ; for L3-T9, L4-T8  $fs \geq 1,8$ ; for L4-T9  $fs \geq 2$ .

In the case of speeds different to those indicated in the catalogue, Table 2 shows the nominal performance corrective factors which take into account the input speeds > 1500 rpm

**Table 2: Factor  $f_N$**

| $n_1$ (min <sup>-1</sup> ) | $8 < i_n < 80$ |      | $i_n \geq 80$ |      |
|----------------------------|----------------|------|---------------|------|
|                            | Tn             | Pn   | Tn            | Pn   |
| 1500                       | 1,00           | 1,00 | 1,00          | 1,00 |
| 1750                       | 0,97           | 1,25 | 1,00          | 1,28 |
| 2000                       | 0,94           | 1,38 | 1,00          | 1,47 |
| 2400                       | 0,92           | 1,62 | 1,00          | 1,76 |
| 2750                       | 0,90           | 1,82 | 1,00          | 2,02 |

Besides on the basis of its mechanical performance, the selection of the gear unit must also be verified on the basis of its thermal characteristics. Table 3 shows the nominal thermal capacity relating to the condition of no auxiliary cooling, at a room temperature of 20°C.

**Table 3: Nominal thermal capacity**

| Size          | 13 | 23 | 33 | 43 | 53 | 63  | 73  | 83  | 93  | 103 |
|---------------|----|----|----|----|----|-----|-----|-----|-----|-----|
| $P_{IN}$ [kW] | 31 | 41 | 53 | 67 | 84 | 104 | 130 | 169 | 209 | 253 |

For different room temperatures, the nominal thermal capacity  $P_{tN}$  must be multiplied by the ambient correction factor  $f_a$  shown in Table 4.

**Table 4: Ambient correction factor  $f_a$**

| Room temperature | $f_a$ |
|------------------|-------|
| 10 °C            | 1,14  |
| 20 °C            | 1     |
| 30 °C            | 0,86  |
| 40 °C            | 0,72  |
| 50 °C            | 0,56  |

$$P_t = P_{tN} \times f_a$$

Checking the thermal capacity is not normally necessary if the period of continuous operation is less than 3 hours and is followed by a period of inactivity long enough to restore room temperature in the gear unit.

## NOTES:

(1) Flexible coupling supplied by *Reggiana Riduttori*. If the coupling is not needed, indicate when ordering. It is best to check max Ø of coupling.

– The dimensions G and D relate to the AC motors 4-12 poles IEC-72

## OVERHUNG LOADS

In the case of driving parts, which could generate overhung loads on the shafts of the gear unit itself, being connected at either input and output, it is best to make sure the gear unit is able to withstand such loads.

The table shows the max values of the overhung loads on the high-speed shaft  $F_{r1}$  and on the low-speed shaft  $F_{r2}$  which are acceptable in the event of the load being applied at centre distance of the shaft end (dimensions U and S of the relevant dimensional tables).

Different cases can occur for which the following indications should be taken into account:

- a) if acting at 0.25 U or S from the gearbox side, multiply such values by 2.
- b) if acting at 0.75 U or S from the gearbox side, multiply such values by 0.67.

In the event of the generated overhung load being below 20% of the values shown on the table, no check need be made.

At the same time as the overhung load, a **thrust load** of 20% of the overhung load is also acceptable.

For higher values, please contact us.

The overhung loads can be calculated approximately, using the following formula:

$$F_r = k \cdot \frac{T}{D}$$

T (Nm) : torque

D (mm) : pitch circle diameter of the keyed component

Where k values are:

1. 2000 for chain drive
2. 2100 for gear drive
3. 3000 for cog belt drive
4. 5000 for V-belt drive

# OVERHUNG LOADS $F_r$ (N)

The values shown refer to the high-speed shaft of the gear unit, in the version with a single protrusion. The moment of inertia referring to low-speed axis can be obtained from the following formula:

$$J_2 = J_1 \cdot i_r^2$$

$i_r$  : actual ratio

## LUBRICATION

### ISO & AGMA Viscosity grade

| Speed $n_2$<br>( $\text{min}^{-1}$ ) | Standard   | Room temperature range (°C) |               |                 |
|--------------------------------------|------------|-----------------------------|---------------|-----------------|
|                                      |            | from -10 to -15             | from 0 to +30 | from +10 to +50 |
| Under 100                            | ISO - AGMA | VG 68 2 EP                  | VG 150 4 EP   | VG 220 5 EP     |
| Over 100                             | ISO - AGMA | VG 100 3 EP                 | VG 220 5 EP   | VG 320 6 EP     |

|--------------------------|---------------|-------------------|--------------|----------------|
| <b>VG 320</b>            | EPX 320       | 1510/320          | 632          | 320            |
| <b>VG 220</b>            | EPX 220       | 1510/220          | 630          | 220            |
| <b>VG 150</b>            | HTX 150       | 1510/150          | 629          | 150            |
| <b>VG 68</b>             |               |                   | 626          |                |

Mineral oil: max running temperature 90°C

Synthetic oil: max running temperature 100°C (110°C for short running).

**Do not mix** up synthetic oil of different brands.

### Oil change interval (h)

| TYPE      | Oil temperature |       |       |
|-----------|-----------------|-------|-------|
|           | 65°C            | 80°C  | 90°C  |
| Mineral   | 8000            | 4000  | 2000  |
| Synthetic | 20000           | 15000 | 10000 |

## STATE OF SUPPLY

### **NOTE: INSPECT THE CONTENTS OF THE INSTALLATION AND MAINTENANCE MANUAL PROVIDED WITH THE GEAR UNITS.**

On receipt of goods, check these correspond to those ordered and that no damage has been caused during transport.

Avoid using even only slightly damaged gear units.

The gear units are coated on the outside with epoxy primer and synthetic enamel blue RAL 5017, which permit further finishes with synthetic paints. If the gear units are used in aggressive environments, ask for adequate painting to be provided.

The shaft ends, hollow shafts, centrings and machined connecting surfaces are protected with anti-oxidisation grease.

The gear units are supplied without lubricant, unless otherwise contractually agreed.

If the gear unit features a backstop device or cooling fan, an arrow near the low-speed shaft indicates the direction of free rotation.

## STORAGE

The gear units must be stored in dry, clean and vibration-free environments. To avoid damaging bearings and seals have the gears perform one complete revolution by means of the high-speed shaft every six months. For storage periods of over one year, the oil filling cap must be replaced with another without breather valve and the gear unit must be completely filled with oil. Every six months, change the grease in the seals and the protective substance on the machined parts.

The gear unit must be adequately painted if stored in an aggressive environment. Also protect the rotating parts and machined surfaces with water-repellent and anti-oxidising grease. In the case of damp environments or where temperature fluctuations are strong, hygroscopic tablets should be used and all the above inspections made more frequently. Protect the gear unit as best as possible from sunrays and weather conditions. In the latter case, protection is mandatory.

If the gear unit is not used for long periods of time, all the machined parts should be protected. Check and lubricate the various connections, change the old oil with new oil of the same type.

In the case of water-oil heat exchangers, the water supply pipes must be removed and cleaned with compressed air, to remove any water inside the pipes. If the exchanger is of the type that can be inspected, it is best to dismantle the pipe nest.

## INSTALLATION

Make sure the structure to which the gear unit is fastened is flat, level and suitably sized to ensure stability and the absence of vibrations. To fasten, use the holes on the 4 sides of the casing and screws of suitable length. For other fastening requirements, contact our Technical Dept.

To lift the gear unit, use the fastening through holes on the casing and try and distribute weight properly. Never lift the gear unit by means of the shaft ends or flanged motors or any accessories fitted to the gear unit.

If cooling fans are fitted, the gear unit must be placed in such a position as to ensure a proper flow of air.

If the gear unit-machine fastening is by means of coupling flanges, it is best to use locking adhesives for the fastening screws.

If backstop devices or cooling fans are fitted, make sure, with the gear unit disconnected, that the direction of motor rotation is correct. If it is not, switch over the motor voltage. Idle start-ups must be gentle with low breakaway currents and reduced stress. If lengthy overloads, knocks or blockage hazards are expected, fit safety hydraulic couplings, control units or other similar devices.
